/note="Vector: 1-ZAP II; Site_1: Eco RI; Site_2: Eco RI;
Genomic DNA was purified from P. furiosus cells and
partially digested with Dra I, Eco RV, Hinc II, Pvu II,
size selected, ligated to Eco RI linkers then cloned into
the Eco RI site of 1-ZAP II, plasmid excision vector.
Excision was performed in batch and individual clones
retrieved by plating."

Not I; Site_2: Sal I; The library was prepared by
Catherine S. Lee and has not been published. The pancreas
was obtained from Gerard Gradwohl (PNAS 97 p1607-1611,
2000). The cDNA's were prepared with an oligo containing a
NotI site, and SalI linkers were added to the ends. The
inserts were cut with NotI before being cloned into the
NotI-SalI sites in the vectors. This is one of two
libraries, ngn3 wt and ngn3 -/-. The ngn3 -/- library is
in psport2, T7 promoter is 3'."

                                                                                                                                                                                                                                                                                                                                                                                                    130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         template-switching PCR method (SMART cDNA, Clontech Inc.,) and sized selected on SizeSep 400 columns (Amersham Pharmacia Blotech Inc.). First strand was reverse transcribed using the CDS III-oligo-dT primer and a 5' template switch primer (Smart IV primer). The product of the first strand synthesis was PCR amplified using the same primer set and the fragments were digested with Sfil. The fragments were size selected, ligated into a modified pBluescript vector containing directional Sfil sites, and electroporated into DH10B or DH12S cells. Vector: Sfil sites were added to the multiple cloning region of pBluescript SK+ between the BamH1/EcoRI sites. The modified polylinker has the following sequence:
                                                                                                                                                                                                                                                                                                                                                                                                    ø
                                                                                                                                                                                                                                                                                                                                                                                           Source: Michael White, Maria E. The DNA was purified from contaminating host DNA by Hoechst DNe 3358-CSC1 ultracentrifugation and precipitated. Purified DNA was digested with mung bean nuclease in the presence of 36-38% formamide at 50 C, as described (Vernick, K.D., Imberski, R.B., and McCutchan, T.F. 1988. Nucleic Acids Research 16:6883-6896). The ends of the digestion fragments were polished using T4 DNA polymerase, and the fragments size selected in the range 500-2000 bp. These were ligated into the EcoRV-cleaved and dephosphorylated pBluescript SK(+)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vector. Recombinant plasmids were used to transform E. coli XL10-Gold host cells. "

Average insert size 1.35 kb (range 0.9-4.0 kb). 15/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo Alto, CA)."
                                                                                                                                                                                                               independent recombinant phage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="Vector: pAMP10; Site_1: Not1; Site_2: EcoRI; 1st
strand cDNA was primed with oligo(dT)17 on 50 ng of
DNAse-treated, total cellular RNA obtained from 5,000-10
,000 microdissected preneoplastic cells
histologically-determined to be prostatic intraepithelial
neoplasia 2 (PIN2) cells. Double-stranded cDNA was
ligated to EcoRI adaptors, 5 cycles of PCR applied to the
cDNA with an adaptor-specific primer, and the resulting
PCR product subcloned into pAMP10 by the UDG-cloning
method (Life Technologies). Average insert size is 600
bp. NOTE: Not directionally cloned. This library was
constructed by David Krizman."

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000
